WEEKLY HEALTH REPORT

NATURE OF THE DATA

The data presented here are taken from the Statistical Reports, Forms 86ab, rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States.

Because of the desirability of placing the information in circulation at the earliest possible time following its receipt, figures are in general shown herein as reported. Where there is some doubt as to the accuracy of the reported figures, their verification is requested, and the fact that they have been so questioned is indicated by the symbol (!).

MORBIDITY DATA

In this report admission rates are shown for all causes (disease and injury) combined, for all diseases combined, for injuries and for a few specific diseases. These rates are presented on an annual basis to facilitate comparisons with corresponding rates in annual and monthly reports. Such annual rates of admission indicate the number of admissions per thousand mean strength which would occur over a year's time if the current week's experience continued for a year.

The report also shows the number of cases of the more common communicable and certain other diseases of special interest. Appended is a list of cases reported for the rarer communicable and certain other diseases.

The number of patients remaining in hospital at the end of the week per thousand strength as given in this report furnishes an approximation to the current non-effective rate. The mean number of non-effectives per thousand strength is given in the summary table for the total United States and for each of the Service Commands.

STATIONS WITH HIGHEST MORBIDITY RATES

Included in the report is a table listing the stations (having a strength of 5000 or over) with the highest morbidity rates from all causes, from all diseases combined, from injuries and from a few specific diseases. Not infrequently, the excessively high rates of admission for all causes and for all diseases combined reported from reception centers reflect a large number of venereal disease cases among newly inducted men. Therefore, more significant of high morbidity from disease are the rates of admission for disease excluding venereal infections existing prior to induction, which rates are also shown in the table.

HOSPITALIZATION DATA

Current hospitalization conditions are presented in terms of bed capacity (normal and total), beds occupied and beds "available vacant." The number of beds "available vacant" is defined as 80% of the total bed capacity less the corresponding beds occupied. The number of beds "available vacant" for each Service Command is the total of the beds "available vacant" for only those stations in which 80% of the total bed capacity exceeds the beds occupied. Beds in dispensaries, convalescent facilities, venereal disease facilities, and college or university training units are not included in this report.

In the case of general hospitals there are shown, in addition, the number of Army patients admitted and disposed of during the week (by death, return to duty, transfer, or otherwise), the number of such patients remaining in hospital (including convalescent facilities, if any) at the end of the week, and corresponding data for battle casualties. Where the hospital has convalescent facilities, the letters (CF) appear after its name. The patients "otherwise" disposed of represent for the most part discharges on account of disability. In the case of Army battle casualties, all of which are currently admitted to general hospitals in this country as transfers, there is shown for each hospital the net number transferred during the week; i.e., admissions by transfer less dispositions by transfer. The total for the country as a whole represents the number of battle casualties evacuated to the United States from overseas theaters.

EXPLANATORY MATTER

In reading the detail tables, it should be borne in mind that admission rates based on small numbers of cases are not reliable. For this reason the symbol (?) is placed after admission rates computed on the basis of 5 or fewer cases.

Where part or all of the current week's data for a particular station has not been received, the latest available figures are substituted therefor and the symbol (#) is placed after the name of the station.

WEEKLY HEALTH REPORT

COMMENT ON CURRENT TRENDS

CURRENT MORBIDITY IN CONTINENTAL UNITED STATES

As indicated in the chart on page three, the admission rates from all causes and from all diseases combined both decreased 3 percent during the week ending 11 February 1944, reflecting chiefly a 5 percent decline in the admission rate from colds, influenza, and pneumonia. The admission rate from all causes was reported at 747 per thousand per year and the corresponding all diseases rate at 680 per thousand; these rates were both about 25 percent below the corresponding rates for the week ending 12 February 1943, at which time morbidity from colds, influenza, etc. was on a relatively high level. The admission rate from injury for the week ending 11 February 1944 was 67 per thousand or on about the same low level as during the preceding five weeks.

The admission rate from colds, influenza, etc. for the week ending 11 February 1944 was reported at 263 per thousand per year. This is the lowest morbidity experienced from these causes since the last week of November 1943 and about 35 percent under that recorded for the corresponding week of February 1943. The admission rate from all forms of pneumonia decreased to about the level prevailing in December 1943, or about 20 percent below that for the corresponding week of February 1943.

The number of new cases of mumps increased more than 30 percent during the week to the highest figure reported since 19 June 1943. New cases of measles and scarlet fever both increased about 10 percent over the preceding week. New cases of meningitis showed a decrease. There was a sharp increase in the number of new cases of rheumatic

fever, the number of new cases reported being the highest since May 1943.

VARIATIONS IN MORBIDITY BY SERVICE COMMAND

The Third, Fifth and Second Service Commands were the only ones to report higher morbidity during the week ending 11 February 1944. Only in the Third Service Command, however, was the increase attributable even in part to higher admission rates from colds, influenza, etc. A sizeable decrease in morbidity was reported from the Military District of Washington, while moderately lower admission rates were reported from the other Service Commands.

The highest morbidity from all causes (of 965 per thousand) continued to be reported from the Seventh Service Command, which was also the only one to report morbidity from colds, influenza, etc. in excess of 400 per thousand. The Seventh Service Command also showed the highest morbidity from all forms of pneumonia (over 40 per thousand), reflecting a very high rate of admissions from pneumonia at Jefferson Barracks, Mo. The lowest morbidity from all causes - 616 per thousand - continued to be reported from the First Service Command. However, the Eighth Service Command experienced almost equally low morbidity from disease, with rate of admissions from colds, influenza, etc. of only 200 per thousand.

Morbidity from venereal diseases (excluding EPTI cases) increased very sharply in the Second Service Command, to reach a rate of 49 per thousand. This is believed to reflect largely a high

WEEKLY HEALTH REPORT

COMMENT ON CURRENT TRENDS (CONT'D)

incidence of venereal infections among task force troops. There were also marked increases in venereal diseases morbidity in the Fifth and Sixth Service Commands.

The largest numbers of new cases of measles continued to be reported from the Fourth and Eighth Service Commands, but the Seventh Service Command showed the greatest increase in new cases. These three Service Commands accounted for nearly 80 percent of the total number of new measles cases. The largest number of new cases of mumps also continued to be reported from the Fourth Service Command, but the Ninth and Eighth Service Command also reported more than 100 cases each, and these three Service Commands between them accounted for nearly 65 percent of the total number of new cases of mumps. Scarlet fever cases were reported as more uniformly spread, but the Seventh, Eighth, and Ninth Service Commands accounted for nearly 60 percent of the total number of cases. The Fourth Service Command continued to report the largest number of meningitis cases. The marked increase in the number of rheumatic fever cases reported was accounted for almost entirely by the increases in the Ninth and Seventh Service Commands.

STATIONS WITH THE HIGHEST MORBIDITY RATES

Of the six stations reporting the highest morbidity from all causes, three were stations with very high admission rates from colds, influenza, etc. (Miss. Ord. Plant, Miss., Greensboro AAFTTC, N.C. and Fort Oglethorpe, Ga.) and two were reception centers (Camp Upton, N.Y. and Ft. Benjamin Harrison, Ind.) with high morbidity due to venereal infections contracted prior to induction.

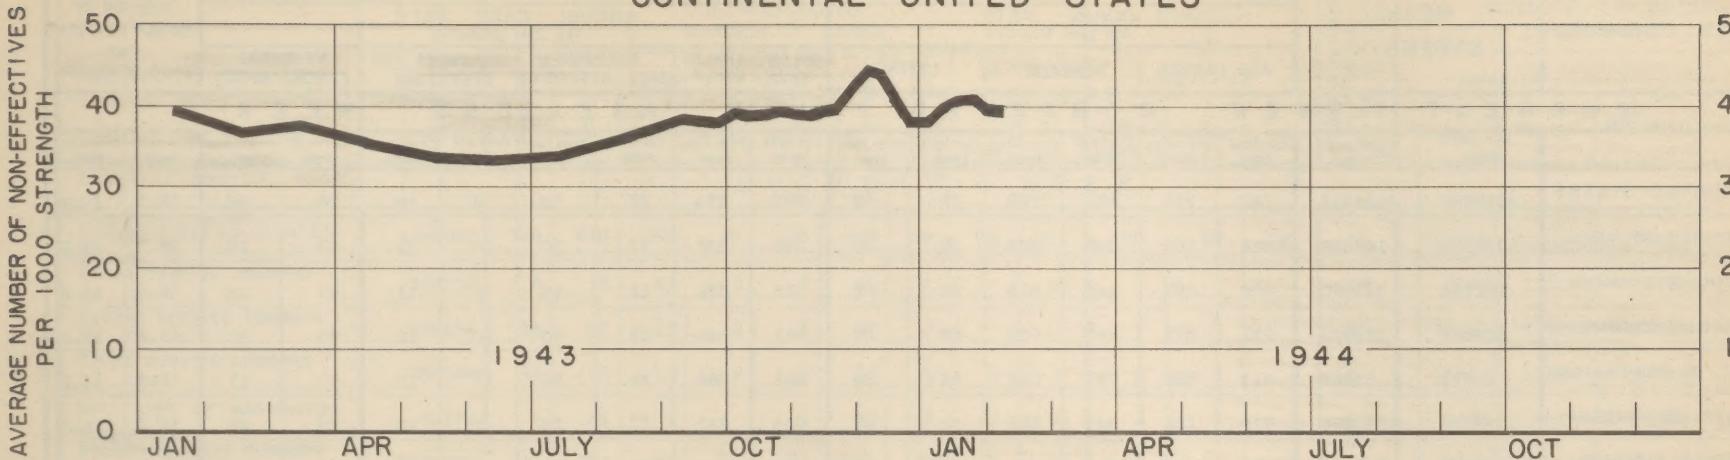

CURRENT HOSPITALIZATION CONDITIONS

The total bed capacity reported as of 11 February 1944 was about 372,000 or 7,000 more than the preceding week. The number of beds occupied as of 11 February 1944 was about 171,000 or 4,000 less than at the end of the previous week; the number of "available vacant" beds increased to 128,000. On 11 February there were 26 stations with a bed capacity of about 16,000 which had no "available vacant" beds; included among them were three general hospitals with a bed capacity of 4,000 beds.

On 11 February 1944 there were 2,097 cases of malaria remaining under treatment, all but 26 of which had presumably been acquired outside of the United States. The number of neuropsychiatric cases remaining at end of the week was reported at 15,930 while the number of tuberculosis cases remaining totaled 1031.

SUPPLEMENTARY HEALTH REPORT

FOR WEEK ENDING 28 JANUARY 1944

COMMENT ON ADMISSION RATES TO HOSPITAL AND TO QUARTERS

For the week ending 28 January 1944, a special study was made to develop admission rates from disease and from injury, separately for cases which involved hospitalization and for those which involved confinement to quarters only. Accordingly the data have been tabulated so as to include with admissions to hospital all cases originally admitted to quarters and then transferred to hospital. This procedure gives a reasonably accurate picture of the aggregate admission rate to hospital and the net admission rate to quarters for cases confined to quarters only.

For the continental United States as a whole, the admission rate from all causes of 835 per thousand strength appears to have been composed of a rate of 729 per thousand for hospital admissions and a rate of 106 per thousand for quarters admissions, so that only 13 percent of the total admissions were cases involving confinement in quarters exclusively. It is noteworthy that this same proportion held true for both disease admissions and injury admissions. The relative proportion of the total admissions which were solely quarters cases varied from a low of 8 percent for the Second and Ninth Service Commands to a high of 18 percent for the Third and Seventh Service Commands. Since the disease admissions represent such a large proportion of the total, the proportion which were quarters cases varied in the same general way as ^{for} total admissions. The number of quarters cases for injury admissions was quite small in most of the Service Commands, so that this proportion has relatively little significance. It is noteworthy, nevertheless, that in the Third, Fourth and Seventh Service Commands more than 20 percent of the injury admissions were to quarters.

Under normal conditions a large military post will have relatively few quarters admissions, representing

only those cases requiring treatment for minor ailments of short duration. However, when hospital facilities are overloaded, the overflow will be channeled for treatment in quarters. This is especially likely to be the procedure when there is high morbidity from common respiratory diseases. In many small units which do not have hospitals and which are not located near a station hospital, there is a tendency to hospitalize patients with other than major ailments in quarters or in the station dispensary (in which case they are properly considered as quarters cases). The latter situation is typical of many training units located at colleges and universities. The general dispensaries in most larger cities show relatively high admission rates to quarters because a sizeable proportion of patients with relatively minor ailments can be under treatment in their own homes or lodgings.

Admissions involving confinement to quarters only in the case of units with a strength of less than 5000 accounted for 19 percent of the total admissions (hospital and quarters) as compared with a corresponding figure of 11 percent for units with a strength of 5000 or over. The Third Service Command had a relatively high proportion of quarters cases because it has many small units with a relatively high proportion of quarters cases. The Seventh Service Command apparently had a relatively high proportion of quarters cases because of the high morbidity from respiratory causes.
